

Building A Solid Foundation

Databerry Can Help You Create a Solid Foundation for Future Business Success!

The growth of technology is rapidly evolving on the web and in the clouds. Using Java and traditional Oracle Reports allows your company to move forward without having to re-invest a substantial amount of time and development costs. Furthermore, these products allow for future expansion of web-based projects and services, easily creating a significant return on investment over the long term.

Oracle Provides Valuable System Flexibility

Oracle continues to invest in and evolve both Traditional Development Tools and Java Development Tools, focusing on the different market needs for each solution. Your company can use applications developed with either of these two sets of technologies together, benefitting from a common deployment and operational environment as well as integration facilities. To accomplish this combination of information systems, Oracle provides runtimes in Oracle Fusion Middleware.

Unparalleled Expertise

A Higher Level of Service

We'll not only help you select the right Oracle products for you and fit them into your IT infrastructure, but we'll also make sure your people know how to use them and modify them to fit your future needs. We've teamed up with Rackspace to provide a higher level of service than any other Oracle hosting platform. Together, Databerry and Rackspace can effectively host and manage any Oracle solution, ranging from standard Oracle database servers to complex, clustered environments with multiple Oracle application and database layer servers.

Moving Your Business Forward

Databerry's Consultants Can Move Your Business Forward

Databerry's lifecycle services can:

- Define your strategy and goals
- Manage your systems
- Identify ongoing business-streamlining enhancements and cost savings

These services offer your company:

- A tight link to product development and support teams
- Best practices through its global engagements in Oracle projects
- A solutions delivery model that provides on-site, off-site, and offshore Oracle expertise

Databerry provides support with Oracle forms and reports – software packages for creating screens that interact with an Oracle database.

In addition, Databerry provides an Oracle Web Cache solution (a content-aware server accelerator, or reverse proxy, for the web tier) that can improve the performance, scalability, and availability of web sites running on any web server or application server, such as Oracle HTTP Server and Oracle WebLogic Server. The Oracle Web Cache can serve large numbers of client requests, offloading the more expensive and complicated application/database servers.

Services

The right Oracle Solution will put you heads and shoulders above your competition. Databerry provides each customer with an individual support plan that meets your company's unique technology requirements – premier Oracle Consulting, Oracle Server Administration, Oracle Integration, Oracle Application Development, and Oracle Upgrades/Maintenance...

Systems Migration

Working with your IT staff, Databerry can ensure a successful migration. Your staff brings expertise in your legacy systems' database, code, and business rules, while Databerry has intimate knowledge of the target platform.

Web Solutions

Consulting, design, and solution implementation services all support the creation, management, processing, and delivery of information and content. Databerry provides full project life-cycle services with the crucial expertise required to recommend and implement change across a broad range of key technologies.
